

# Climate Change is changing the world

## Climate Change is destroying the environment

The effects of climate change are very bad for humans and the environment. It is causing major changes in annual climate cycles, destroying lots of property and homes. The change in patterns also messes with animals' migration cycles. climate change isn't doing anyone any favors.

We will be feeling the affects of climate change for years to come. The sea levels are going to rise and there will be an increase in flooding in places all over the Earth. Forest fires will become more prevelant because of a warming Earth, they will also become much worse than they have been. Famine may become a problem with an increasing population and less water and arable land to grow the food because of climate change.

"Nor does hadly anyone ever mention that we are in the midst of the sixth mass extinction, with about 200 species going extinct every single day."

- Greta Thunberg

## Turtles are getting lost at sea

The number of tutles coming to a beach and laying their eggs each year is rapidly decreasing. You can tell that this is true by going to a beach in the summer *where tutles lay their eggs* and you can compare it to a beach in the summer in the future and notice the diffenence. **Save the Turtles**

You can save the turtles by using reusable straws, such as metal ones. This helps to eliminate the amount of material that can kill turtles in the oceans. Turtles not only provide us cute pictues of them, they are also vital parts of ocean **ecosystems**.
